A, Residues: 9-14,23-29,30-53 oGON>

C, Comment: Mammalian neurofilament proteins: a conserved alpha-helical region, whose hele all other intermediate filament proteins: a conserved alpha-helical region, whose hele C, Comment: The amino-terminal headpiece is basic with a high content of hydroxyamino acid all beta turns; domain b is acidic and rich in glutamic acid and lysine residues.

C, Comment: The extra mass and high charge density that distinguish the neurofilament procharged scaffolding structure suitable for interaction with other neuronal components of C, Comment: This protein was isolated from spinal cord.

C, Superfamily: cytoskeletal keratin

C, Superfamily: cytoskeletal keratin

N.Alternate names: neurofilament light polypeptide (68K)
N.Contains: Glu-50 brain peptide
C.Species: Homo sapiens (man)
C.Species: Homo sapiens (man)
C.Date: 29-Jan-1993 #sequence revision 29-Jan-1993 #text_change 21-Jul-2000
C.Accession: S07144; I52832; Ā60703

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

a test Diagnosing paraneoplastic syndrome e.g. paraneoplastic limbic encephalitis or neoplasm e.g. colon cancer comprising assessing sample for the presence or absence of antibodies to a Ma family polypeptide.

Claim 48; Fig 6; 27pp; Japanese.

The present invention describes a method for diagnosing a paraneoplastic syndrome or neoplasm. The method comprises assessing a test sample for the presence or absence of antibodies to a Ma family polypeptide (I). The method is used to diagnose a paraneoplastic syndrome especially paraneoplastic limbic encephalitis and/or brainstem encephalitis or neoplasm in an individual. The method diagnoses the neoplasm by assessing antibodies to (I) preferably Mal, which is indicative presence of breast cancer, colon cancer, parottid gland cancer, lung cancer, testicular cancer and germ-cell tumours or Ma2, which is indicative of testicular cancer, germ-cell tumours or Ma2, which is indicative of testicular cancer, germ-cell tumours or the present sequence is the Ma3 protein as given in the present invention

```
The present sequence is the protein sequence of human onconeuronal antigen Ma2. The invention discloses the detection and differential expression and regulation of the Ma2 gene in specific brain regions of AD patients. The Ma2 gene and its transcription and/or translation products may have a causative role in the regional selective neuronal degeneration typically observed in AD, or may confer a neuroprotective function to the remaining nerve cells. Methods are claimed for diagnostic function to the prognosticating a neurodegenerative disease, for monitoring the prognosticating an eurodegenerative disease, and for evaluating treatment of a neurodegenerative disease, and for evaluating treatment of a neurodegenerative disease, and for evaluating the product of an Ma onconeuronal antigen gene, especially Ma2. Also claimed product of an Ma onconeuronal antigen gene, especially ma2. Also claimed of are: a method for treating or preventing AD and related neurodegenerative diseases are an exthod for treating or preventing AD and related neurodegenerative diseases are method of screening for modulating agents of neurodegenerative diseases

The present invention describes a method for diagnosing a paraneoplastic syndrome or neoplasm. The method comprises assessing a test sample for the presence or absence of antibodies to a Ma family polypeptide (I). The method is used to diagnose a paraneoplastic syndrome especially paraneoplastic limbic encephalitis and/or brainstem encephalitis or neoplasm in an individual. The method diagnoses the neoplasm by assessing antibodies to (I) preferably Mal, which is indicative presence of breast cancer, colon cancer, parotid gland cancer, lung cancer, testicular cancer and germ-cell tumours or Ma2, which is indicative of testicular cancer, germ-cell tumour and lung cancer. The present sequence is the Ma4 protein as given in the present invention
                                                                                                                                      ö

ABA93702 to ABA9376 represent human cDNA sequences from the present invention which encode the proteins given in ABB0562 to ABB05729. The human cDNA sequences and clones can be used in gene therapy. The clones may be used in a variety of applications, for example they may be used in profiling assays, for providing large arrays of human genetic material for implementing large-scale screening strategies and

The present invention describes a method for diagnosing a paraneoplastic syndrome or neoplasm. The method comprises assessing a test sample for the presence or absence of antibodies to a Ma family polypeptide (I). The method is used to diagnose a paraneoplastic syndrome especially paraneoplastic limbic encephalitis and/or brainstem encephalitis or neoplasm in an individual. The method diagnoses the neoplasm by assessing antibodies to (I) preferably Mal, which is indicative presence of breast cancer, colon cancer, parotid gland cancer, lung cancer, testicular cancer and germ-cell tumours or Ma2, which is indicative of testicular cancer, germ-cell tumours or Ma2, which is indicative of testicular cancer, germ-cell tumours or lung cancer. The present sequence is the Ma5 protein as given in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1;

AAC74446 to AAC77606 encode the proteins given in AAB40237 to AAB43397,
which represent the human ORFX open reading frames 1 to 3161. The ORFX
sequences have activities such as: cytostatic; hepatotropic, vulnerary;
antigorniatic; antiparkinsonian; nootropic; neuroprotective; osteopathic;
anticonvulsant; antiarthriti; immunosuppressant; immunostimulant;
cardiant; thrombolytic; coagulant; vasotropic; antidiabetic; hypotensive;
dermatological; immunosuppressive; antiinflammatory; antibacterial;
antiviral; antifungal; antirheumatic; antithyroid; and antianaemic. The
sequences can be used for determining the presence of or predisposition
coperated of treating pathological conditions associated with an
COPRY-associated disorder. The nucleic acids can be used to express ORRX
proteins in gene therapy vectors. The proteins and nucleic acids may be
used to treat cancers, proliferative disorders, neurodegenerative
disorders, osteoarthritis, graft vs host disease, cardiovascular disease,
diabetes mellitus, hypertension, hypothyroidism, cholesterol ester
storage, systemic lupus erythematosus, severe combined immunodeficiency

Isolated polypeptide with a human membrane associated protein sequence is useful for the diagnosis, prevention and treatment of cell proliferative, autoimmune/inflammatory, neurological and gastrointestinal disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          (MEMAP) given in AAB14695 to AAB14731. MEMAPS have cytostatic, antiinflammatory, anticonvulsant, immunosuppressive, antidiarrheic and antiarteriosclerotic activities, which can be used in gene therapy. MEMAPs can be used to treat a disease or condition associated with decreased expression of functional MEMAP and antagonists of MEMAP are used to treat a disease or condition
(SCID), AIDS, viral, bacterial or fungal infection, malaria, autoimmune disorders, asthma, allergies, aplastic anaemia, burns, wounds, bone and cartilage damage, nocturnal haemoglobinuria, antiinflammatory disease; to

proliferative, autoimmune/inflammatory, neurological and gastrointestinal disorders. The MEMAP polynucleotides and proteins are also used for the diagnosis of these disorders. Specific examples of these disorders include cancer, inflammation, atheroselerosis, epilepsy and diarrhoea. MEMAP proteins can be used to screen for compounds which specifically bind MEMAP including antibodies, oligomucleotides, proteins and small molecules. MEMAP polynucleotides can be used to prepare transgenic animals which can be studied to provide information concerning human detection of MEMAP protein and can be useful in immunoassays for the detection of MEMAP protein and can be useful in immunoassays for the concertion of MEMAP protein and can be useful in immunoassays to treat or prevent a disorder associated with MEMAP. Polynucleotides encoding MEMAP can be delivered to target cells with MEMAP. Polynucleotides encoding MEMAP can be expression of MEMAP to treat or prevent a disorder associated with neapest to the expression of MEMAP to treat or prevent a disorder associated with
overexpression of functional MEMAP. These disorders include cell

preferentially expressed in human adult and fetal brain tissue useful diagnosis, treatment and analysis of cancer and mental disorders. DNA

Claim 1; Page 56-60; 73pp; Japanese.

The present invention relates to novel human secretory or membrane proteins (ADA54072-ADA55710) and their coding sequences (ADA52433-ADA54071). The coding sequences are useful in the gene therapy of

Claim 14; SEQ ID NO 1978; 205pp; English.

```
7
The invention comprises the amino acid and coding sequences of seven human proteins that are preferentially expressed in adult whole brain, foetal whole brain, tonsil and adult hippocampus tissue. The DNA sequences are useful for the analysis of disease-associated single nucleotide polymorphism and the production of knockout and human disease model mice. The DNA and protein sequences of the invention are useful for the prevention (vaccine) and treatment of cancer and neurological disorders. The present amino acid sequence represents a human protein of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to human polynucleotides and the polypeptides they encode. The polynucleotides and polypeptides are useful in diagnostics, forensics, see mapping, medical imaging, identification of mutations responsible for genetic disorders or other traits, assessing biodiversity and producing many other types of data and products dependent on DNA and amino acid sequences. They are also useful for preventing, treating or ameliocating medical conditions, such as cancer, neurodegenerative disorders (e.g. Parkinson's disease, Alzheimer's disease), lymphoid cell

                               periodontal disease, liver fibrosis, infections (e.g. viral, fungal or bacterial) or autoimmune diseases (e.g. diabetes, atopic dermatitis). Sequences ABG99888-ABG99989 and ABU00010-ABU00433 represent human polypeptides of the invention. Note: The sequence data for this patent not represented in the printed specification but is based on sequence information supplied by the European Patent Office

The secreted proteins and their genes are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. CC Pathological conditions can be diagnosed by determining the amount of the new protein in a sample or by determining the presence of mutations in the new protein in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the 24 genes, cared on the tissues in which they are most highly expressed, and include developing products for the diagnosis or treatment of proliferative disorders, tumours, foetal and developmental abnormalities, diseases (e.g., rheumatoid arthritis), inflammation, allergies, considered disorders (e.g., Alzahimer's disease, Parkinson's disease), cognitive disorders (e.g., Alzahimer's disease, Parkinson's disease), cognitive disorders, schizophrenia, asthma, skin disorders (e.g., psoriasis), sepsis, diabetes, atherosclerosis, cardiovascular disorders, angiogenic disorders, indoevers, atherosclerosis, and infections. The proteins can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to subburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues, to identify their cognate ligands or binding to resentate tissues, to identify their cognate ligands or binding protein of the invention can be used in alleviating symptoms associated with the disorders mentioned above, and in diagnostic immunoassays e.g., protein of the invention a human secreted protein fragment referred to the invention a human secreted protein fragment referred to the invention a human secreted protein fragment referred to the invention

AMEDIAL AMBOLIST -AMBEDIAL represent the proteins they encode.

The Secreted proteins and their genes are useful for preventing. Treating or ameliorating medical conditions, e.g., by protein variants or fragments.

The Secreted proteins and their genes are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy.

Co rameliorating medical conditions, e.g., by protein or gene therapy.

Co Pathological conditions can be diagnosed by determining the amount of the new protein in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the 24 genes, the new protein in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the 24 genes, correct, tumours, foetal and developmental abnormalities, haematopoietic disorders, foetal and developmental abnormalities.

Co diseases (e.g., theumatodia truthitis), inflammation, allergies, haematopoietic disorders (e.g., Alzheimer's disease, Parkinson's disease), espesis, diabetes, atherosclerosis, cardiovascular disorders, cognitive disorders, tidhey disorders gestrointestinal disorders, angiogenic disorders, tidhey disorders gestrointestinal disorders, angiogenic disorders, tidhey disorders gestrointestinal disorders, pregnancy-related disorders, and each wound healing and epithelial cell correct respensate, to identify their cognate ligands or binding partners, and in chemotaxis, and can be used to a subpurn, to maintain organs to reservative to modify storage properties. Antibodes specific for a protein of the invention can be used in alleviating symptoms associated with the disorders mentioned above, and in diagnostic immunoassay or enzyme linked immunosobent assay (ELISA). The preserve to the invention as human secreted protein fragment referred to in the disclosure of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated nucleic acid molecule encoding a human secreted protein is used in preventing, treating or ameliorating a medical condition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1 DLMHIVQADNPSISVEECLEAFKQVFGSLESRRTAQVRYLKPYQEEGEKVSAYVLRLETL

20-SEP-2001.

The invention relates to isolated NOVX (NOVX1-11) polypeptides and the CC polymucleotides that encode them. NOVX polypeptides, polymucleotides and anti-NOVX antibodies are useful for treating or preventing a pathology associated with NOVX polypeptide in humans and for treating a syndrome cassociated with human disease e.g. disorders characterised by altered cassociated with human disease e.g. disorders, angiogenesis and cortility, proliferation and magration e.g. cancer, angiogenesis and concornal dominant myokymia, stroke, Parkinson's disease, Alzheimer's disease, non-insulin dependent diabetes mellitus, asthma, hypertension and seizure (NoV4), enamel defects, such as amelogenesis imperfects and disorders involving enamel defects, including hypoplasia and disorders involving enamel defects, including hypoplasia and cortestication (NOV5-7), paraneoplastic neurological disorders, e.g. hypomineralisation (NOV5-7), paraneoplastic neurological disorders, e.g. disorders, diabetes, reproductive health, metabolic and endocrine disorders, gastrointestinal disorders, immune disorders and autoimmune disorders, leukaemiallymphoma and tissue/cell growth regulation disorders (NOV8), lesional psoriatic skin (NOV9-10) and atheroscalerosis, abdominal content aneurysm and neurological disorders (NOV11). NOVX polypeptide is also useful for identifying a pherapeutic agent expressing NOVX polypeptide is useful for identifying a therapeutic agent

```
for use in treatment of a NOVX related pathology. The antibodies and a polypeptide having 95% sequence identity to NOVX polypeptide are useful for treating a pathological state in a mammal. The present sequence represents NOV8, a possible neuronal antigen-like protein

Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length

Claim 8; SEQ ID NO 16040; 2537pp + Sequence Listing; English.

The present invention describes primer sets for synthesising 5602 full-length CDMs defined in the specification. Where a primer set comprises:
(a) an oligo-dr primer and an oligonucleotide complementary to the complementary strand of a polymucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polymucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to a

```
polynucleotide which comprises a 3'-end sequence, where the oligonucleotide comprises at least 15 nucleotides and the combination of the 5'-end sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH13628 and AAH13631 to AAH13632 represent human amino acid sequences; and AAH13632 represent coligonucleotides, all of which are used in the exemplification of the
